SKILL DEVELOPMENT PROGRAM-2

TITLE: Design thinking opportunities through UI Automation & Excel

**Workshop Report on Design thinking opportunities through UI Automation & Excel
conducted by Department Of MCA**

Department of MCA, The Oxford College of Engineering is association with ICC organized an one day workshop on “Design thinking opportunities through UI Automation & Excel” on 6th March 2023.The event has been kick-started with a formal Inaugural function, the following dignitaries were present and motivated the students.

- Ms Divyashree M, MD Kasiaex Solutions Pvt. Ltd.
- Dr. N Kannan, Principal, The Oxford College of Engineering
- Dr. Puja Shashi, Head-MCA, The Oxford College of Engineering

Introduction:

Design thinking is an iterative problem-solving approach that focuses on understanding user needs and finding creative solutions to meet those needs. User Interface (UI) automation is the process of automating user interactions with an application's graphical user interface (GUI). Excel is a popular spreadsheet software used for data analysis, reporting, and visualization. In this report, we will discuss the application of design thinking in developing UI automation using Excel.

Design Thinking Process:

The design thinking process consists of five stages: empathize, define, ideate, prototype, and test. The first stage, empathize, involves understanding the user's needs, motivations, and pain points. The second stage, define, involves defining the problem statement based on the insights gained from the empathize stage. The third stage, ideate, involves generating ideas and selecting the best ones based on their feasibility, viability, and desirability.

Application of Design Thinking in UI Automation Using Excel:

The application of design thinking in developing UI automation using Excel involves understanding the user's needs, defining the problem statement, ideating potential solutions, creating a prototype, and testing the prototype.

Empathize:

The first step in developing UI automation using Excel is to understand the user's needs. In this case, the user is a person who performs repetitive tasks using Excel, such as data entry, data manipulation, and report generation. To understand the user's needs, we can conduct user interviews, surveys, and observation. We can ask questions such as:

Define:

The problem statement for developing UI automation using Excel can be "The user spends a significant amount of time performing repetitive tasks in Excel, resulting in reduced productivity and increased errors."

Ideate:

The ideate stage involves generating potential solutions to the problem statement. Some potential solutions for developing UI automation using Excel are:

Use Excel VBA (Visual Basic for Applications) to automate repetitive tasks.

Use Excel macros to automate repetitive tasks.

Based on the feasibility, viability, and desirability of the potential solutions, we can select the best solution for the user. In this case, we will select the Excel VBA solution because it is easy to implement, does not require additional software, and can be customized to meet the user's specific needs.

Prototype:

The next step is to create a prototype of the solution. The prototype for UI automation using Excel VBA can be a macro that automates a repetitive task such as data entry, data manipulation, or report generation. The macro can be created using the Excel VBA editor, which provides a development environment for creating macros.

Test:

The final step is to test the prototype with users and gather feedback to refine the solution. The user can test the macro with their data and provide feedback on its usability, effectiveness, and efficiency. Based on the feedback, the macro can be refined to meet the user's specific needs.

Outcome:

In Outcome, design thinking is an iterative problem-solving approach that can be applied to developing UI automation using Excel. The design thinking process consists of five stages: empathize, define, ideate, prototype, and test. By applying the design thinking process.

Total of 21 Faculties and 118 Students from all department have attended the Program.

Workshop Report on Skill development program of Python Programming conducted by Department Of MCA

Department of MCA, The Oxford College of Engineering is associated with ICC organized an Student Development Program on “**3 Day boot camp on Python Programming**” on 11 to 13th Jan 2023. The event has been kick-started with a formal Inaugural function, the following dignitaries were present and motivated the students.

- Dr. N Kannan, Principal, The Oxford College of Engineering
- Dr. M S Shashidhara, Head-MCA, The Oxford College of Engineering

Introduction:

Python is often hailed as one of the best programming languages for first-time coders to learn as they break into programming. It's the main technology powering big data, finance, and statistics, and its clean syntax reads like English. Python developers are in demand, not to mention the average Python developer in New York City earns \$140,000 per year! Companies like Amazon, Dropbox, and Dell are built on this powerful language, making it a great time to learn Python bootcamp. We're breaking down Python bootcamps, across the country and online, for a range of price points and time commitments

Python is a back end programming language, which is often used by data scientists, software engineers, and cyber security engineers. Python can be as a web programming languages and it can be used for creating data sets, web scraping, and scripting. Since Python syntax is very similar to English, it is a great first language for beginners to learn. Python is a well-documented language and the community is welcoming, which also makes it a great first programming language for coding newbies!

Step 1: For coding beginners, learn Python online with free courses so you can build a foundation in Python. A good free Python course should teach the fundamentals of Python through Python exercises and mini projects.

Step 2: Once you've got the fundamentals down, it's time to enroll in a coding bootcamp or a data science bootcamp! Learning more about Python with qualified instructors and an expert-created curriculum will help you build the knowledge you need for a software engineering or data role. We've made it easy to find a bootcamp that works for you through our Get Matched tool.

Step 3: When you are an experienced Python programmer, it's time to specialize. With advanced Python knowledge, you can specialize in data science or machine learning.

Total of 16 Faculties and 118 Students from all department have attended the Program.

The Oxford college of Engineering, Bangalore, Skill Development Lab with Department of **Mechatronics Engineering** organized workshop on "**3 Days Workshop on Robotics and Automation**". by Mr. Nandhagopal on 29/3/2023 to 31/3/2023.

Mr. Nandhagopal is an Application Engineer with high drive, high energy level, achievement-oriented, tireless in the pursuit of personal & Organizational goals, he has also trained more industrial people and has vast experience in robotics and automation. Number of students attended the session are 45 and faculties 5.

Objective:

The objective of the session is to bring the awareness about Industrial automation and robotics are the use of computers, control systems and information technology to handle industrial processes and machinery, replacing manual labour and improving efficiency, speed, quality and performance.

During the session the resource person explained about the its applications and highlighted the points.

- Robotics involves the design, construction, operation, and use of robots.
- The goal of robotics is to design machines that can help and assist humans.
- The term Robotic Process Automation (RPA) brings the image of physical robots performing labor-intensive activities, like cleaning a house, lifting heavy objects, doing every work as a human worker.
- The application of technology, programs, robotics or processes to achieve outcomes with minimal human input.

Benefits of Automation

- Lower operating costs.
- Improved worker safety.
- Reduced factory lead times.
- Faster ROI.
- Ability to be more competitive.
- Increased production output.
- Consistent and improved part production and quality.
- Smaller environmental footprint.

Industrial Robot Applications

- Arc Welding. Arc welding, or robot welding.
- Spot Welding.
- Materials Handling.
- Machine Tending.

- Painting.
- Picking, Packing and Palletizing.
- Assembly.
- Mechanical Cutting, Grinding, Deburring and Polishing.

Future of Robotics and Robots

- We can expect to see more significant numbers of increasingly sophisticated robots incorporated into more areas of life, working with humans.
- Contrary to dystopian-minded prophets of doom, these improved robots will not replace workers.

Outcomes:

In addition to life skill development outcomes, youth will observe how the robot performs, question why the robot performed as it did and troubleshoot the program using the information gathered. One of the top ways educational robotics can benefit learning outcomes is by promoting creative problem-solving skills. Problem based learning is a new learning model that promotes creative problem solving with the use of a robot.

By the 2030s, the future of robotics in manufacturing could be completely autonomous, from assembly to quality control, thanks to advancements in AI and the Internet of Things (IoT). Robot maintenance and operation will replace traditional jobs in this industry.

DEPARTMENT OF CIVIL ENGINEERING
SKILL DEVELOPMENT PROGRAMME

NAME OF THE LABORATORY : PLUMBING SERVICES IN CIVIL ENGINEERING

APPLICATION : Plumbing is said to be the system of pipes, tanks, fittings, and other apparatus required for water supply, heating, and sanitation in a building. Plumbers install, repair, and maintain piping systems in residential, commercial and industrial buildings. These systems traditionally included water distribution and wastewater disposal, but because of new technology that combines water and gas pipes, plumbers can work with vent, residential fire, irrigation, and chemical systems as well. The duties of a plumber include: installing, repairing and maintaining pipes, fixtures, and other plumbing equipment; opening walls and floors to accommodate pipes and pipe fittings; welding, connecting, and testing pipes for leaks; preparing cost estimates; interpreting blueprints and designs. Plumbers must also be aware of safety procedures and follow them at all times.

Learning Outcomes:

After undergoing this course, the students will be able to:

- Identify and select proper tools and use them for the given plumbing work
- Select appropriate pipes and carry out pipe fitting after carrying out operations like cutting, bending, threading, joining, aligning and other necessary operations
- Erect simple water supply system. Trace leakage and repair water supply system
- Plan, prepare and inspect domestic drainage system
- Select and install sanitary appliances

- Install heating appliances like geyser, etc

Skill Lab Activity -Training Optical Slicing Machine

The Oxford college of Engineering, Bengaluru, Department of Electronics and Communication Engineering Organized Skilled lab activity on Optical Slicing Machine at R & D Lab on 24-11- 2022 to 25-11-2022 from 09:00 AM to 4:00 PM .

Objectives of the Event :

- To familiarize Utilization of a Optical slicing
- Various methods can be used to achieve optical slicing
- To facilitates advanced techniques for optical slicing

Optical slicing, also known as optical sectioning or optical tomography, is a technique used in microscopy and imaging to create high-resolution, three-dimensional images of biological samples or materials. It allows researchers to visualize internal structures and details within a sample without physically sectioning it.

The principle behind optical slicing involves capturing images of a sample at different focal planes, typically using a microscope or a specialized imaging system. By acquiring a series of images at different depths, a stack of two-dimensional slices is obtained. These slices can then be combined to reconstruct a three-dimensional representation of the sample.

Various methods can be used to achieve optical slicing. One common approach is confocal microscopy, which uses a pinhole to reject out-of-focus light and selectively capture fluorescence emitted from the focal plane. Confocal microscopy provides excellent axial resolution, but it can be time-consuming due to the serial acquisition of images.

Another technique is two-photon microscopy, which uses two photons of lower energy to excite fluorescent molecules within the sample. This method allows for deeper imaging into thick samples, as it reduces scattering and phototoxicity effects compared to confocal microscopy.

Other advanced techniques for optical slicing include light sheet microscopy (also known as selective plane illumination microscopy or SPIM) and optical coherence tomography (OCT). Light sheet microscopy illuminates the sample with a thin sheet of light from the side, reducing phototoxicity and

enabling high-speed imaging of large samples. OCT, on the other hand, utilizes low-coherence interferometry to capture cross-sectional images of biological tissues with micrometer-scale resolution.

Optical slicing techniques have widespread applications in various fields, including biology, medicine, materials science, and geology. They enable researchers to investigate the internal structures of cells, tissues, and materials, leading to a better understanding of their composition, organization, and dynamics.

50 participants including 15 faculties and 35 students from different departments participated in the above training.

Outcomes of the Event:

The Participants were able to learn:

- The Utilization of a Optical slicing
- The Various methods can be used to achieve optical slicing
- The advanced techniques for optical slicing
