a. SOLAR PV PANEL

Our institution has implemented energy conservation measures by installing solar panels in the campus to reduce power consumption. The surplus power (institutional consumption total power generated) generated out of the solar panel is used by the electricity board. The institution purchased the Solar Panel on 17 August 2014.

Renewable energy generated and used – 300KW

Overview of Solar Panel

b. BIO - GAS PLANT

The college authorities have installed a biogas plant in the college campus to process food waste and other biodegradable garbage generated in the campus. The plant is capable of processing up to 50 kg waste daily. It has been set up at a cost of Rs. 1 lakh. The project has been funded by the College Development Council.

I. Research Methodology:

The feedstock is collected from the messes and transported to plant small scale prototype. The required quantity of feedstock and water is mixed in the inlet tank and the slurry is discharged to the digester vessel for digestion. The gas produced throughmethanogenesisby bacteria in the digester and gas is collected in the dome the generation of biogas for respective feed is obtained.

II. Design Based Calculation:

Prototype,

Dome Height=0.54 m

Dome Diameter=0.46m

1 cubic meter = 1000 litre

For Cooked Food, the Feed to Water Ratio is 1:3

Working of Biogas Plants: Biogas is a clean and efficient fuel. It is a mixture of methane (CH₄), carbon dioxide (CO₂), hydrogen (H₂) and hydrogen sulphide (H₂S). The chief constituent of biogas is methane (65%)

Production of Biogas: The fixed- dome type of biogas plant is used for the production of biogas. The microorganisms present in the digester are capable of decomposing the substance in the absence of air, thus, they are also called as the anaerobic bacteria. This biogas produced in a biogas plant has many commercial and household applications, like; this biogas can be used as a fuel, even as a kitchen gas, and also in gas engines.

c. WHEELING OF GRID

Wheeling of electricity is implemented more in urban areas especially for Solar PV. It plays an important role for technologies like wind and hydro power. Wheeling of electricity enables the customers to offset their power consumption from the utility.

d.

USE OF LED BULBS/ POWER EFFICIENT EQUIPMENT

Conventional fluorescent and incandescent tube lights in the college were replaced progressively by LED lamps. Installation of LED Bulbs in the campus has ensured a significant reduction in power consumption.
